At this age of DIY, a set of well-made tools is a home must, but that doesn't mean they should be all muscle and not style. Alice Supply Co.'s newest hammers and screwdrivers, sporting sailors-blue-and-white stripes, are a refreshing addition to the toolkit. Heavy bodies are comfortable (and beautiful) to solve assembling necessary bookcases and other tasks. The set makes a smart housewarming gift or perfect send-off for a design minded college student. Sea Hammer, \$26, and screwdriver, \$26, Alice Supply Co.; aliceSupplyCo.com. For more information on what we love, click here. This content is created and supported by a third party and is imported to this page to help users provide their email addresses. You may be able to find more information about this and similar content on [piano.io Home Tools](#), [Gear and Equipment Tools](#) and [Family Handyman Delivery](#) to solve the toughest home improvement problems with twenty of the best tool tips we have ever published. These tips are a tool nugget of wisdom from experienced pros, experts and smart readers. They will save you time, effort and money. According to DIY family expert Handyman Magazine You can also sniff: TBDA is a quick way to cut brickScore and break the brick in just seconds with the diamond blade in the corner of the grinder. Angle grinders are handy tools, especially if you're working with tiles or masonry. Here's how to use one to cut bricks if you don't mind a little rough edge. Equip the meat grinder with a diamond blade and then score the brick on your back about 1/2 inch deep where you want to break. Put the brick chisel in the account, give it a kick, and the brick will break. I've worked in this magazine (and now the website) for 20-plus years and learned passed great tool tips and techniques during that time. For this issue, which is all about tools, I rummaged through deep archives to get some of my personal favorites. They cover homes and stores, indoors and out. I hope you learn as much from them as I did. If you want to get power into the pond or just want an outlet in the back 40, you may have to run the wires under the sidewalk. Here's how to do it. The idea is to drive 1/2 inch long of a hard electric pipeline under a walk. You will need a line from both ends of the pipeline: one end to hold the dirt, the other so you can pound on it without damage. We recommend 1/2-in. connect and connect at both ends. Lift the canal from the bottom of the trench with some and blow away. Video: Hand tool hacks and modifications for woodworking-and-dirty support long boards Ladder stairs like a pair of extra hands while cutting long things. Well, we recognize that a proper miter saw stand is better, but if Just cutting a couple of long pieces, here's a quick way to support them. Just clamp a piece of scrap on the back legs of the stepladder. You will have to snake the boards through the stairs to support them, but the ladder is a solid rock and you can customize the support piece so it is perfectly level with the saw table. Mark the pipe before gluing together the joint alignmentMark your tubular joints so you can unwind them quickly when gluing. When you are working with PVC pipes, dry fit fittings and pipes to make sure they are in the right position. Use the level where appropriate. Then tick off the pipe and fitting so you can get them back to exactly the same position when you are bonding the joint. PVC cement sets up quickly! Dry concrete for the pillars of the fence Moisten dry concrete mixture around the post and moisten it after assembling the fence. If you place fence pillars in concrete and you want to get the job done quickly, you can sometimes brace the pillars and pour dry concrete mixture around them. Keep it a couple of inches below the soil line. Continue the carpentry business, and when you're all done, soak the top of the mixture in each hole. You don't have to move. The top will be installed quickly, and the dry mixture below will slowly absorb moisture from the soil. Mark on the camouflage tapeMark on the camouflage tapeMark cutting marks on the camouflage tape. Then remove it after making the incision. I use camouflage tape more for marking than for camouflage. This is useful when the surface is dark and won't show a pencil line (such as the laminate countertop shown) or if you want the sign to be temporary, such as when you're marking the stud position on the wall. You can use it to mark the cutting line and just cut through it. You can use a white delicate surface tape on the wallpaper. Use epoxy resin to hard-to-clamp joints Tolaring the side of the railApply quickly installing epoxy resin and press the joint tightly together until the fast-setting epoxy hardens. Sometimes you come across wooden joints that are very difficult to clamp, such as the odd angle miter shown, or very small pieces of finish. That's when quickly installing epoxy resin comes to the rescue. Mix it, apply on both surfaces, and keep the pieces together in the exact position you want until the glue sets. You can use 90-second epoxy resin, or if you want more power (and you have more patience), use a five-minute variety. Two tapes for a large layoutSy perpendicular linel two tapes to set the perpendicular line quickly and easily. Use two tapes to mark the perpendicular line on a large layout. Mark the approximate central point on the baseline and then mark the endpoints a few feet from each side of the central point. Pull two ribbons and adjust them so that the ends at the endpoints, and the measurements are identical where the tapes intersect. That's where to mark the perpendicular line. Snap a line and you're done. Lock the pliers for pulling nailsPull headless nailLock pliers tightly on the nail shank and snatch it from the pry bar. Vise-Grips lock pliers are a great tool for pulling pulling I use them in three situations. The first one shown here is to pull out a stubborn nail that has lost its head. Second, pull trim gun nails that have such a small head that the hammer can't grab it. The third is to remove the nails that remain in the finish you remove. In this case, it is best to pull them off your back using lock pliers. My favorite type is shown: The curved ends of the jaws make it easy to lever out the nails. Burnish external miter to close it to a small gap in the miter joint slightly rubbing over the sharp edge. Sometimes just the act of nail miter joint makes it open a bit. If the gap is not too big, you can close it by rubbing the sleek metal tool hard against the corner. It pushes the wood fibers inside. Almost any tool will work as a utility knife is shown, or a round tail screwdriver. The glue hanging follow the hollowBaseboard braceClose small gaps along the pendant with glue and a temporary brace. The walls sometimes have gentle hollows that are not obvious to the eyes, making it difficult to attach the finish without leaving a gap. If the finish is generally flexible, you can apply the building glue to the top and bottom edges and then figure out a way to put pressure on it. 2x4 against the floor runs for the crown, and for the baseboard you can cut a couple of scraps and nail them to the floor at an angle. The ideal position is to handrail the RailUse ladder board and frame the area to create anchor points for the handrail. Building regulations usually require that handrails be 34 to 38 inches above the foot (cutting edge) ladder protectors. But how do you figure that out and also get handrail braces over studs? You can draw all kinds of lines all over the wall, or use the method shown. Mark the vertical line where your studs are, lay 1x2 on the stairs, and slide the framing area along the 1x2 to the end of the 2-foot area hits the stud line. For a little more height, use 1x3 or 1x4 instead. Shim with screwShim baseboardTurn screw in or out for support and smooth the board against drywall. If there is a gap, sometimes the drywall screw is the perfect adjustable shell. For example, when you apply a hanging, drywall at floor level is often dried backwards, making it difficult to get hanging corners to line up well. A pair of screws driven to the bottom of the wall quickly solve the problem, and do so much faster than filling the area with a joint connection. Make a circle with a square out of the circle Mark circle with two nails and framing the square. Here's a tip for laying out small circles or parts of circles. Tack two nails to set the diameter you want and then rotate the framing area against the nails while you hold the pencil in the corner of the square. You may have to rub a little wax or other lubricant on the bottom of the area so it slides easily. Don't ask us why The process works, everything we know he's doing. Manual screws for fast viseHand viseHand viseTighten a pair of hand screws on the board. Then clamp them. Old-fashioned hand screws still have a place in the DIYer toolkit, for several reasons. Here's one. You can make a quick grip to hold the board on the edge with a few side screws and small bar clamps. Set the hand screws to about the thickness of your blank, clamp them down and you're going to go. You can use the same trick for the doors, but clamp the hand screw so it extends past the end of the sawhorse. Use the alignment of cleatsAligning edges tile Use temporary cleat to support and perfectly align the tile. Tacking on cleat is one of the most tame tricks in the book. Use cleat to align tiles, as shown on the shown, or cabinets, closet doors or anything else that needs to be lined up or level. Cleat often serve to hold things, free your hands to attach them. Nails, trim, fill, finishFill nail holesMix several shades of putty exactly match the color of the tree around the nail hole. For natural finish and wood, it is best to wait until the first layer of stains and varnish on the tree before filling the holes for the nails. So the tree is close to its finishing shade and color and it is sealed so the putty stays only in the hole. Get a few shades of putties and mix them until they match the wood. Calibrate the lawn spreaderCalibrate to your spreaderMeasure spread by your broadcaster to avoid excessive fertilizer. If you have a broadcast distributor, there is a trick to get the most uniform application of fertilizer with it. Clean the road first. Then fill the dispenser, dial in the appropriate setting and spread some fertilizer on your road at a normal walking pace. Measure roughly how far the fertilizer spreads on both sides (usually one side should be wider than the other). Write a measurement on a piece of duct tape at the top of the distributor and use the information to guide your app. Sweep fertilizer on your road and discard or reuse. Install the door with an angular cleatsCleat door to stopUse cleats exactly to keep the joint in place when installing it. To install the interior prehung the door, the slick trick is to screw cleats through the top two corners, and 1x4 cleat through the hole of the feet above the floor. Hitting the doorway against these cleats will ensure that it is parallel to the wall. If you shell out cleats with a few sheets of heavy paper, the joint will remain a little proud of the drywall, so that the door enclosure fits nicely and snugly.
